

AI Interview Platform - Progress Report (Phase 1)

Objective

Build a production-quality AI Coding Interview Platform while understanding every concept instead of copying tutorials.

Completed Work

1. Created backend using Node.js and Express.
2. Initialized npm project and installed Express & Nodemon.
3. Built first Express server on port 5000.
4. Organized backend into controllers, routes, middleware, models, config and utils.
5. Created Home API and Health API.
6. Learned GET vs POST requests.
7. Enabled `express.json()` middleware.
8. Built POST `/api/users/signup` endpoint.
9. Used `req.body` to receive client data.
10. Tested APIs successfully using Postman.
11. Implemented manual validation for name, email and password.
12. Learned HTTP status codes (200, 201, 400).
13. Used object destructuring to extract request data.

Current Architecture

Client -> Express Server -> Routes -> Controllers -> JSON Response

Current Folder Structure

```
backend/  
  controllers/  
  routes/  
  middleware/  
  config/  
  models/  
  utils/  
  server.js  
  package.json
```

Concepts Learned

Express.js, REST APIs, Routing, Controllers, Request & Response, JSON, `express.json()`, `req.body`, HTTP methods, HTTP status codes, Postman testing, backend validation, project structure.

Next Milestones

Install PostgreSQL, Prisma ORM, create Users table, hash passwords with `bcrypt`, implement JWT authentication, build login system.

Summary

The backend foundation is complete. The project now follows a clean, scalable architecture and is ready for database integration.
